

Linked Data for Tourism

Irem Önder, Marta Sabou, Adrian M.P. Brasoveanu

How many tourists arrive to the top 3 largest cities of Austria in 2012?

Information needs:

- Which are the top 3 largest cities in Austria?
 - Hard coded: Vienna (population), Graz (population), Salzburg (population).... →(Wikipedia)
- Total arrivals for Austrian cities in 2012 (Vienna, Graz, Salzburg...) →(TourMIS)

Accommodation: All forms of accommodation

Two data sources

TourMIS

Official statistics of the Austrian National Statistical Office (Annual data)

Arrivals and GDP of source markets

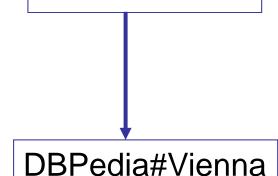

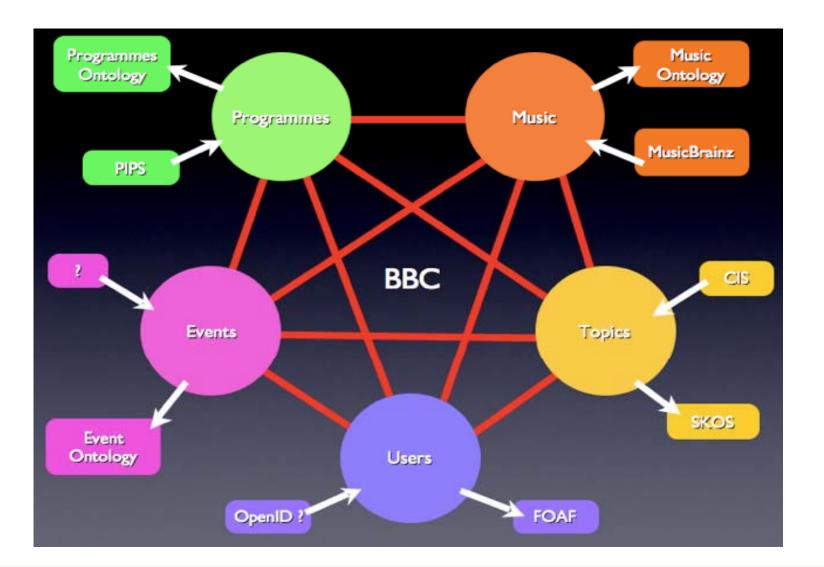

A set of technologies to say that:

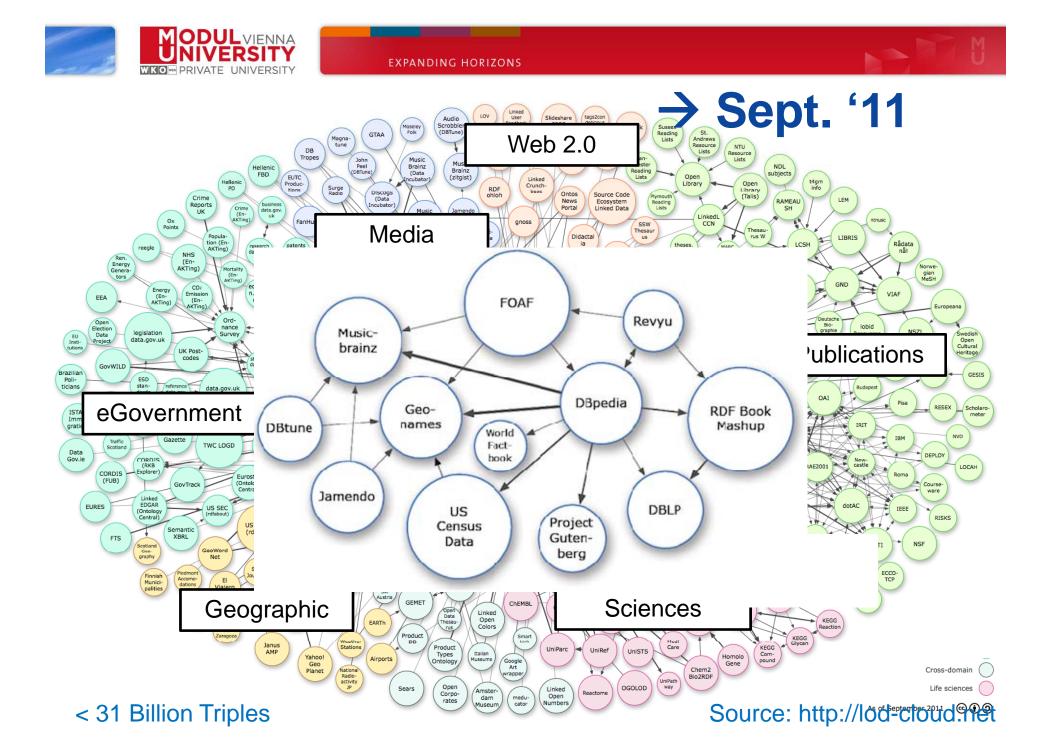

Entity in Database 1 TourMIS#Wien "IS THE SAME AS" Entity in Database 2

... so that machined can perform more intelligent tasks by THEMSELVES.

Linked Data at MODUL (2012)

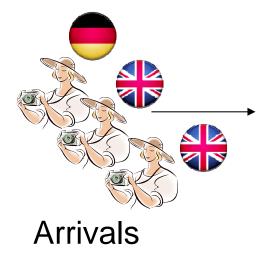

- Types of decisions
 - Predict future demand for tourism services
 - Benchmarking cities, regions, countries
 - Predicting new markets
 - Planning new infrastructure etc
- Decisions involve:
 - Combining tourism statistics from different sources thus benefiting form extended coverage
 - Combining tourism statistics with other types of indicators (e.g., sustainability indicators)

Tourism Indicators

Open (but not yet Linked) Data

- Critical for supporting decision makers BUT hampered both at syntactic and semantic level
- Syntactic:
 - mostly open data, BUT
 - offered using different syntactic formats that require substantial effort for integration (e.g., especially when extracted from pdf files ..)
- Semantic:
 - Different geographic granularity
 - Measurements at different time intervals
 - Different ways to measure the same indicator
 - None of these differences are explicit in a machine format => need an analyst to understand and combine the data

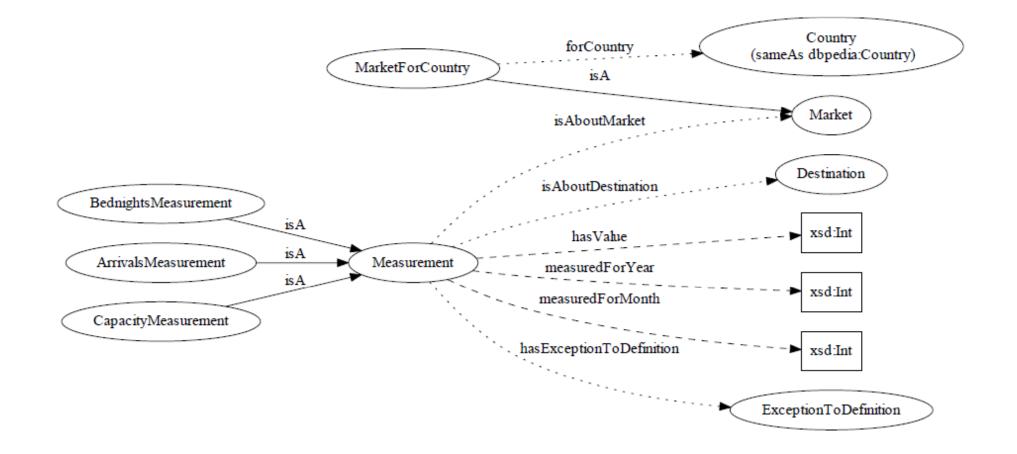

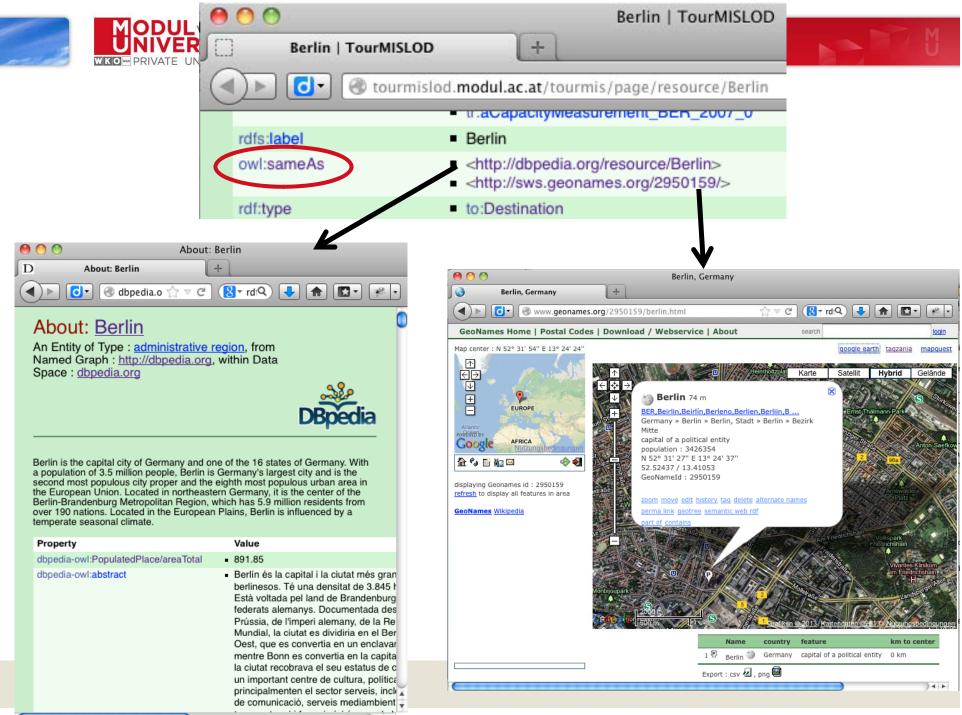

- Arrivals, Bednights, Capacity indicators
- From 1985 onwards
- 154 EU destinations and 19 markets
- Annual and monthly measurements

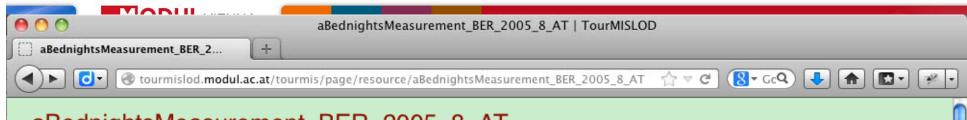

<data>
 <destination>BER</destination>

rdf:type	 to:BednightsMeasurement to:Measurement rdfs:Resource owl:Thing 	

- ~1 million triples
- Data subset contains:
 - 1586 Arrivals measurements, 1985-2012, all destinations, annual values, total market
 - 9989 Bednights measurements, in 2005, all destinations, all markets, monthly values
 - 107 Capacity measurements, 2007, all destinations, annual

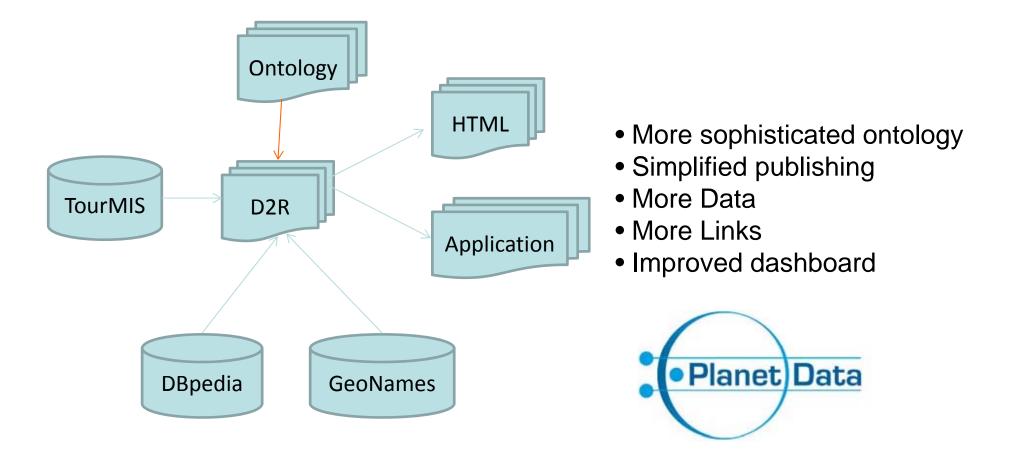

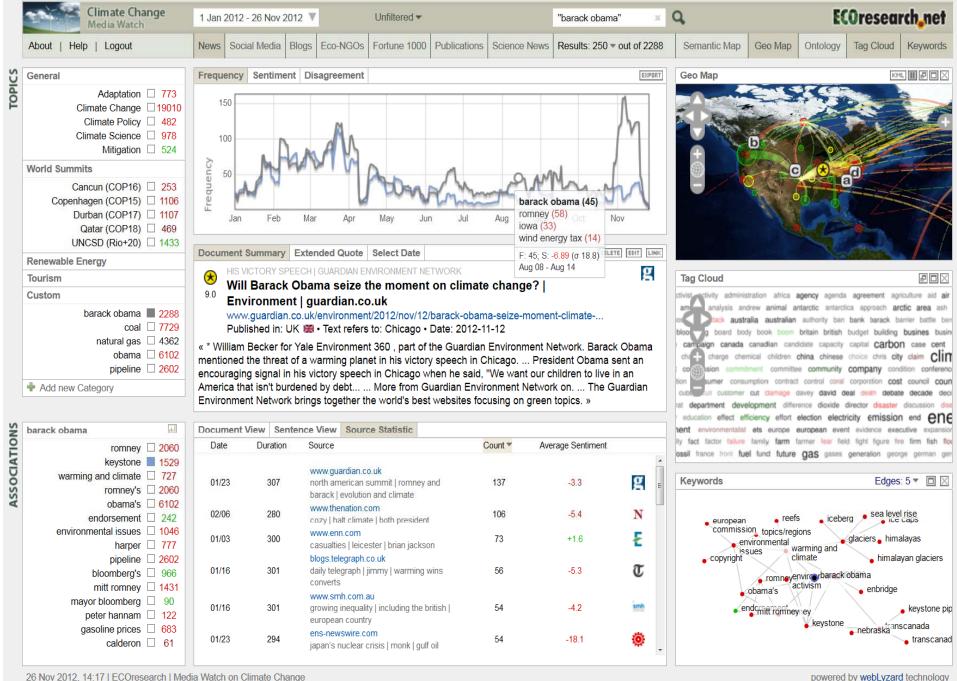

- A data access infrastructure to solve syntactic differences and foster data integration (done)
 - Links allow easy integration of data from DBpedia
- Links allow harvesting new (missing data)
 - e.g., get destination's country from Dbpedia (done)
 - Harvest additional details
- Semantics allow for a formal specification of measurement details and therefore help solve semantics differences (work in progress)
